3-way tables: Alcohol Cigarette, and Marijuana Use

Survey asked 2276 students in their final year of high school in a nonurban area near Dayton, Ohio whether they ever used alcohol, cigarettes, or marijuana.

| Alcohol | Cigarette | Marijuana Use | |
|---------|-----------|---------------|-----|
| Use | Use | Yes | No |
| Yes | Yes | 911 | 538 |
| | No | 44 | 456 |
| No | Yes | 3 | 43 |
| | No | 2 | 279 |

This is example of a $2 \times 2 \times 2$ contingency table. Shorthand: A=alcohol, C=cigarette, M=marijuana.

Contingency Tables: Death Penalty Example

The 674 subjects where defendants in murder cases in Florida between 1976 and 1987.

| Victim's | Defendant's | Death | Penalty | Percent |
|----------|-------------|-------|---------|---------|
| Race | Race | Yes | No | Yes |
| White | White | 53 | 414 | 11.3 |
| | Black | 11 | 37 | 22.9 |
| Black | White | 0 | 16 | 0.0 |
| | Black | 4 | 139 | 2.8 |
| Total | White | 53 | 430 | 11.0 |
| | Black | 15 | 176 | 7.9 |

| | No | 2 | 279 |
| | | | |

$$Y_{ijk} \sim Poisson(\lambda_{ijk})$$

Conditioned on total (*N*) $Y_{ijk} \sim Multinom(N, \pi_{ijk})$. π_{i++} be probability of row A = i, π_{ij+} be probability of A = i, C = j, etc.

• Each pair of A,C, and M has homogeneous association.

$$\lambda_{ijk} = \lambda \lambda_i^A \lambda_j^C \lambda_k^M \lambda_{ij}^{AC} \lambda_{ik}^{AM} \lambda_{ik}^{CM}.$$

e.g. the dependence relationship of A, C does not depend on M.

Analysis of 3-way tables

- Fit log-linear model (Poisson GLM) for each of the models.
 - Criterion: maximum likelihood.
 - 2 Fitting method: Newton Raphson.
- 2 Use a model selection criterion to choose the best one.
 - AIC, BIC.
 - 2 Use Deviance χ^2 test to choose between nested models.

```
glm(..., family=poisson), loglm(MASS) in R.
```
